			ART UNIT 1751	PAPER NUMBER
			MAIL DATE 07/26/2007	DELIVERY MODE PAPER

**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

<b>Office Action Summary</b>	Application No.	Applicant(s)	
	10/803,880	ODA ET AL.	
	Examiner	Art Unit	
	Kallambella Vijayakumar	1751	

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

#### Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### Status

- 1) ☒ Responsive to communication(s) filed on 08 May 2007.
- 2a) ☐ This action is FINAL. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

#### Disposition of Claims

- 4) ☒ Claim(s) 3,5,7,9,11,13,15,17 and 22-30 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 3,5,7,9,11,13,15,17 and 22-30 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

#### Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

#### Priority under 35 U.S.C. § 119

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

Art Unit: 1751

***Detailed Action***

Applicant's response filed along with the amendment dated 05/08/2007 have been fully considered. Claims 3, 5, 7, 9, 11, 13, 15 and 17 were amended. New claims 22-30 added. Claims 3, 5, 7, 9, 11, 13, 15, 17 and 22-30 as amended are currently pending with the application.

The indicated allowability of claims 11, 13 and 15 is withdrawn in view of the newly discovered reference(s) to Kang et al. Rejections based on the newly cited reference(s) follow.

Applicant's amendment overcomes the rejection of claim-2 under 35 USC 112-II Paragraph and the prior art by over Sasaki et al (US 6,368,378) cited in the last office action.

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary. Applicant is advised of the obligation under 37 CFR 1.56 to point out the inventor and invention dates of each claim that was not commonly owned at the time a later invention was made in order for the

Art Unit: 1751

examiner to consider the applicability of 35 U.S.C. 103(c) and potential 35 U.S.C. 102(e), (f) or (g) prior art under 35 U.S.C. 103(a).

1. Claims 3, 5, 7, 9, 11, 13, 15, 17 and 22-30 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kang et al (US 5,296,189).

Kang et al teach making a grain growth control adhesives for a conductive paste containing metal (Cu) particles mixed with additive particles such as alumina by jet impact milling of the particles. The prior art teaches that the alumina particles of desired size and quantity can be mixed with copper powder and subjected to high energy milling in a ball mill to achieve intimate mixing (Abstract). The starting size of the alumina particles was from about 0.05 to about 0.1 micron. The starting size of the copper particles was from about 2 to about 5 micron (CI-4, Ln 35-40; CI-5, Ln 25-37). The milled particles were reduced in size in a jet mill using opposing streams of a suitable fluid <slurry> (usually compressed air or other inert gas such as nitrogen) carrying the material to be pulverized, are made to collide in an impact chamber until their average size distribution reaches a much finer range (CI-5, Ln 47-59). Further fluids include liquids and gases.

The prior art fails to teach the metal particle size to be less than 0.5 micron and the wetting undried metal particles having been water washed metal particles.

However the prior art teaches that desired particle sizes could be used, and it would have been obvious to a person of ordinary skilled in the art to use finer particles of metals as a choice of design of operational function of the jet mill, because generally, differences in concentration or temperature or particle size will not support the patentability of subject matter encompassed by the prior art unless there is evidence indicating such concentration or temperature or particle size is critical. "[W]here the general conditions of a claim are disclosed in the prior art, it is not inventive to discover the optimum or workable ranges by routine experimentation." In re Aller, 220 F.2d 454, 456, 105 USPQ 233, 235 (CCPA 1955).

The examiner asserts that the treatment of the prior art metal particles in a fluid will be substantially same as applicants wetting of undried metal particles. The omission of drying the wet metal particles in the instant claimed process step will be prima facie obvious over the particles used by the prior art in the

Art Unit: 1751

slurry, because Omission of an Element/step and Its Function Is Obvious If the Function of the Element Is Not Desired Ex parte Wu , 10 USPQ 2031 (Bd. Pat. App. & Inter. 1989) <MPEP 2144.04>.

With regard to claim-13, the prior art particle size of 0.05 micron size for alumina further meets the limitation of ceramic particle size with relation to the metal particle size in claim-13.

With regard to claim-15, the prior art teaches copper as an example of a metal in conductor paste, and it would have been obvious to use nickel in place of copper as functional equivalent in the process and composition of Kang et al with reasonable expectation of success, because it was well known to form conductor paste containing nickel and ceramic powder (See Takeuchi, US 4,551,357) and prior art teaches metal conductor paste.

With regard to claims 3, 22 and 26, the prior art teaches colliding opposing streams of the fluid dispersion of the particles, and the composition of opposing streams will be substantially the same.

With regard to claims 5, 7, 9, 23-24 and 27-29, the prior art teaches an alumina particle size of 0.05 micron.

With regard to claims 17, 25 and 30, the prior art teaches an conductor forming paste. The use of phrase "to form an electrode on ceramic dielectric substrate" in the claims have not been treated with patentability. A recitation of the intended use of the claimed invention must result in a structural difference between the claimed invention and the prior art in order to patentably distinguish the claimed invention from the prior art. If the prior art structure is capable of performing the intended use, then it meets the claim. In a claim drawn to a process of making, the intended use must result in a manipulative difference as compared to the prior art. See In re Casey, 152 USPQ 235 (CCPA 1967) and In re Otto, 136 USPQ 458, 459 (CCPA 1963).

2. Claims 3, 11, 15 and 26 are rejected under 35 U.S.C. 103(a) as being unpatentable over Serafin et al (US 5,852,076).

Serafin et al teach a method of making magnetic dispersions and other dispersions of hard, non-compliant particles such as magnetic pigments such as iron oxides, alumina (ceramic), magnetic metal particles and color pigment particles, wherein the process stream is split in to two or more streams and

Art Unit: 1751

recombined after passing through restrictive orifices (0.1-1 mm) configured for the streams to impinge on each other at high velocities at various angles of contact (Abstract, Fig-2, CI-3, Ln 23-30, 40-43; CI-5, Ln 16-22; CI-5, Ln 47-58). The agglomerates of the process stream was finer than 60 mesh size and further teaches that the orifice size could be adjusted if the particle sizes vary (CI-6, Ln 41-44). The claimed conductivity will be obvious over the electrical conductivity of magnetic metals such as Fe, Co and Ni and their alloys.

The prior art fails to teach wetting undried metal particles having been water washed metal particles and silent about the metal particle size per the claims.

However, the prior art teaches forming a slurry and splitting the streams to impinge on each other, and the examiner asserts that the treatment of the prior art metal particles will be substantially same as applicants wetting of undried metal particles. The omission of drying the wet metal particles in the instant claimed process step will be prima facie obvious over the particles used by the prior art in the slurry, because Omission of an Element/step and Its Function Is Obvious If the Function of the Element Is Not Desired Ex parte Wu , 10 USPQ 2031 (Bd. Pat. App. & Inter. 1989) <MPEP 2144.04>. With regard to particle size, the prior art teaches processing agglomerates up to about 60 mesh size (i.e. up to 250 microns) and the presence of fine particles including 0.5 micron metal particles in this slurry would be obvious. With regard to claim-15, it would have been obvious to a person of ordinary skilled in the art to select Nickel in the slurry from a limited number ferromagnetic metals such as iron, cobalt and nickel in the process of Serafin.

With regard to claims 3 and 26, the prior art teaches splitting a process stream to more than one stream that impinge on each other, whereby the composition of different streams will be substantially the same.

3. Claims 5, 7, 9, 13, 23-24 and 27-29 are rejected under 35 U.S.C. 103(a) as being unpatentable over Serafin et al (US 5,852,076) in view of Kang et al (US 5,296,189).

The teachings on the method of making magnetic dispersions and other dispersions of hard, non-compliant particles by Serafin et al as set forth in rejection-1 under 35 USC 103(a) is herein incorporated.

Art Unit: 1751

The prior art fails to teach the ceramic particle size per the claim 13 and the particle size ratios per the claims 5, 7, 9, 23-24 and 27-29.

In the analogous art, Kang et al teach making compositions containing metal particles mixed with additive particles such as alumina by choosing desired size and quantity of alumina mixed with copper powder, premixing in a high energy milling in a ball mill (Abstract) and milling the particles in a jet mill using opposing streams of a suitable fluid <slurry> that are made to collide in an impact chamber until their average size distribution reaches a much finer range (CI-5, Ln 47-59). Further fluids include liquids and gases. The starting size of the alumina particles was from about 0.05 to about 0.1 micron. The starting size of the copper particles was from about 2 to about 5 micron (CI-4, Ln 35-40; CI-5, Ln 25-37).

The particle size of ceramic alumina and the ratio of the particle diameters of the components in the process of Serafin et al would be obvious over the teachings of Kang et al, because the process of making dispersions of hard particles comprising genus of magnetic metals and alumina ceramic encompasses the species of paramagnetic Cu and alumina ceramic of Kang, and the prior art teachings use common jet-milling in making the composition.

### ***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Kallambella Vijayakumar whose telephone number is 571-272-1324. The examiner can normally be reached on 8.30-6.00 Mon-Thu, 8.30-5.00 Alt Fri.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Douglas McGinty can be reached on 571-272-1029. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
